

GAMMATRONIX

Electronic Ignition Systems (6v POS, 12v POS)

Description

The Gammatronix "Blacktop" Electronic Ignition System is an easy to fit enhancement to any classic and older vehicle with conventional points based ignition system.

Modern vehicles benefit from electronic, high energy ignition systems. By fitting a Gammatronix unit, your classic vehicle can also enjoy these benefits. Retaining your original contact breaker (but removing the condenser), you get the improvements of a modern electronic ignition system, with minimal changes to your classic or older vehicle. Our unit is an easy fitment, and compact at only approx 100mm x 50mm x 20mm in size.

Advantages

- Easier starting, Smoother running
- Higher energy spark promoting improved fuel combustion.
- Better average fuel consumption due to car remaining in tune
- No burning or pitting of points - no need for points replacement at each service! 50,000 mile typical contact breaker life

Compatibility

- 12v positive and 6v positive, depending on version.
- For vehicles using conventional coil / points ignition, battery driven. Good for all rev ranges and cylinder combinations.
- NOT suitable for "magneto" based ignition systems that operate direct from a generator stator without a battery – mopeds, trials bikes, some classic Brit bikes etc.

Installation

Simply mount the unit with the fitting kit and instructions supplied (no drilling required). Remove the points condenser, and connect up the four wires (power, earth, contact breaker and coil).

The unit has a handy yellow LED which can be used as a 'timing light' to indicate if the points are open or closed, and to confirm correct installation and operation.
